

Python Food register analysis

Authors: José Luis Madrigal Sánchez

During the semester, there was an excel made to have information to work with. First a graphic of each biomolecule of the diverse food was shown, having things like calories, protein, carbohydrates, lipids and sodium.

There was a comparison of each biomolecule with the calories, in this case the carbohydrates.

Finally, here are the predictions of the calories were made with a basic machine learning algorithm based on scikit learn library.
